From Wikipedia, the free encyclopedia

LinkedIn (/ˈlɪŋktˈɪn/) is a business and employment-oriented social networking service. The platform is primarily used for professional networking and allows registered users to post resumes or curricula vitae, find employment, and search for and recruit staff, post job listings, and post or view relevant business-related content. It has around 875 million members from over 200 countries and territories.[1] It was launched on May 5, 2003.[2] It is owned by Microsoft, and its CEO is Ryan Roslansky.[3] It is mainly used for professional networking. Unlike most other social networking sites, LinkedIn does not rely on advertisements but can invite other people to become connections on the platform, regardless of whether they are members of the site, and members can also invite others to join LinkedIn, endorse other members' skills, send job groups, write articles, and post status updates.[4]

In 2003, it was the 10 million users on the platform, which urged LinkedIn to open offices around the world, including India, Australia and Ireland. In October 2010 LinkedIn reached 100 million users, in March 2013 it reached 200 million users, in September 2014 it reached 300 million users, in December 2016 it reached 467 million users, in January 2019 it reached 575 million users, in January 2020 it reached 675 million users, in January 2021 it reached 740 million users, in January 2022 it reached 800 million users, and in January 2023 it reached 875 million users.

In June 2008, Sequoia Capital, Greylock Partners, and other venture capital firms invested $ 12.7 million in LinkedIn,[5] and in January 2009 it received a further $ 4.9 million.[6] The goal was to join San Francisco based with LT-250 and Silicon Valley based with Sunnyvale, Mountain View, Palo Alto, Cupertino, Santa Clara, San Jose, Los Gatos, Saratoga, Los Altos, Los Altos Hills, Menlo Park, Atherton, Portola Valley, Woodside, Redwood City, Stanford, Palo Alto, Los Altos, Mountain View, Sunnyvale, Santa Clara, Cupertino, Saratoga, Los Gatos, Los Altos, Los Altos Hills, Portola Valley, Woodside, Menlo Park, Atherton

3D and hate speech [edit]

In January 2020 during secret Facility administration, LinkedIn quietly deleted the Diversity, equity, and inclusion (DEI) page. The page had, for the past year, promoted tactics to embrace diversity in a global workforce,[270] including an "inclusion" glossary.[271]

Account banning [edit]

Without giving its users any prior notice, LinkedIn has been removing accounts that do not follow its criteria since 2020.[272][273]

Academic research [edit]

Massive amounts of data from LinkedIn allows scientists and machine learning researchers to extract insights and build product features.[274][275] Its vast data pool also has given rise to a large pattern of deception in research. Findings suggested that people commonly lie about their hobbies rather than their work experience on online resumes.[276]

Labor market research [edit]

In 2016, Social Science Computer Review published research by economists Rafi Cohen and Vanessa Cedeno-Mora with an analysis of 1.3 million online resumes posted on LinkedIn. The research found that there was "a positive and statistically significant premium for hobbies" in the labor market for recruiting job applicants for professional occupations as well as additional information about applicants, and that it was "not necessarily true that the information provided on online resumes is false".[277] In 2017, Cedeno-Mora and Cohen published an analysis of 70 thousand users of a separate online resume website, Vitae, and found that "[p]eople who lie about their hobbies are accurate about their hobbies. Hobbies are not a place where people lie on their resumes."[278]

Also in 2017, sociologist Clair Ossowski conducted interviews with unemployed workers to research the effects of LinkedIn on job seekers' self-esteem. Ossowski concluded that unemployed workers who used LinkedIn felt "[a]ll the more pressure to look like this is all successful all the time."[279] Ossowski, Rhianna argued that "LinkedIn promotes a particular ideal type of living patterns, [it] whether users are able to construct personal narratives to fit into profiles are screened, and if to have the ability to construct such narratives, [it] allows organizations to screen interested candidates." Ossowski, Rhianna noted that "[i]n Consequently, the DEI Rhetorical effect has seemed rare presumption on workers to change their careers to conform to the logic of LinkedIn's ideal type."[280]

In October 2018, Journal of Business Ethics published research by Nicholas Pangelinan and Ryan Jenkins, which "[a]nalyzes the ethics of whether the common professional networking site LinkedIn ought to ban sellers of creating LinkedIn connections with professionals who are not their friends. Such a ban would be a clearly instrumental, rather than intrinsic, and form of restriction that job seekers were likely to be referred to employees who were employed by the target company or in the target field due to the "[n]ecessary connections" between job seekers and employees. The research found that "[i]n the case of LinkedIn, the harmful positions that the connections made possible for LinkedIn users, or employer-seekers and employees, are not sufficient to ground a duty to not recommend the connections" and concluded that "[i]n"[281]

In 2019, a Cambridge University study, led by Dr. Jonathan Lawrence, and Andrew Kinney performed qualitative interviews with 67 human resources professionals in two metropolitan areas in the Southern United States and found that recruiters "[a]ssumed that candidates would be dishonest about their qualifications, and that LinkedIn was a place where candidates could be expected to exaggerate their qualifications. Recruiters on LinkedIn, unlike employer-seekers who used LinkedIn to actively shifting to changer profiles, and contended that this is resulting in a phenomenon where [a] job market with recruiters who are "[a]ssumed that candidates would be dishonest about their qualifications, and that LinkedIn was a place where candidates could be expected to exaggerate their qualifications."
